# CC Validator

| INPUT | OUTPUT | COMMENTS |
|---|---|---|
| 16 digit invalid card number | message error box stating the card is invalid | initially was getting a exit code error, but realised i messed up the syntax |
| 16 digit valid card number | message box stating card was valid | used PyLuhn to verify then printed into terminal, then finally created message box |
| input using with letters | error box stating user inputted a string | originally started with .isalpha, but that wouldn't pick up any letters past index 0 so swapped to isnumeric() which fixed it and also picked up symbols |
| input a card number !16 digits | error box stating input was !16 | only used len, which worked as intended from start |
